 - *Java-based Lobby & Game servers*
 - *Java-based Skill Server*
 - *Downloadable PC & Mobile clients w/ automatic sync updates*
- *Licensing*
 - *Term, perpetual, full source ownership*
- *Consulting Services*
 - *Implementation Project Management*
 - *Technical Programming*
 - *Customizations Maintenance*

Leading entertainment and gaming operators are now adapting to the recent surge in poker's popularity by opening physical as well as virtual poker rooms in various localities catering to global players in multiple legal jurisdictions. To cater to this demand we have introduced the Supergame Gaming Suite, which allows gaming operators to offer "entertainment only" as well as "real-money gaming" virtual poker, casino and bingo rooms.

Gaming Suite is a complete solution allowing gaming operators to run virtual poker room, casinos and bingo operations via a fully web-based application that automates all back-office processes such as game distributions & monitoring, statistical reporting, promotional announcements and new player orientation. You can keep on top of day-to-day varying demands in real-time as well as pre-schedule recurring game variations. You can track player behaviors and trends as well as misc. operational statistics, allowing you to plan promotions and affiliate marketing events. To provide site popularity perception, you can choose to deploy a number of robots, with a varying loose to tight play modes.

Gaming Suite is an open system built on best-of-breed and widely adopted technologies, providing re-assurance that IT staff can learn the platform design in a short time and support it on an on-going basis.

Gaming Suite provides very intuitive user interfaces for the players, allowing them to easily view the lobby, search for game variations, join tables, ante up, post blinds, interact with other players and leave at will. Furthermore, for new comers to the game of poker, you could design multi-media instructional or orientation material using popular 3rd party tools and plug-in the material into site and track attendance.

Mature pre-built functionality provides for fast time-to-value

Gaming Suite is the result of extensive development efforts by subject matter experts in the areas of multi-player, interactive and internet-based games software as well as virtual poker room audit procedures. The platform has been in development since 2002 and has recently reached maturity with the introduction of a mobile user interface catering to players who own mobile devices with broadband and/or wireless carrier enabled internet access. For entertainment and gaming operators, whose core competency is not in the area of software development, it would take many person-months (years) to reach the level of maturity of Poker Suite. Hence, to reduce time-to-market and provide value to your customers as soon as possible, it would seem prudent to buy vs. build.

Intuitive & Flexible End-user interfaces

Gaming Suite delivers key information to your staff via a fully web-based back-office interface, using intuitive screens and workflows. The players on the other hand have a choice of a PC based interface, wherein they can engage in normal-capacity games (2 to 10 players) or a Mobile device interface with reduced capacity (2 – 6) and functionality. The mobile interface enables players to play and learn poker from anywhere their mobile device can gain internet access, e.g. Airports, City Center hot spots, etc.

Solution protects your investments and lowers total cost of ownership

Gaming Suite is one of first software solutions that provides features to enable gaming operators to attract and train new comers to the game of poker, bingo and others “globally”, as well as direct their global customers to their physical poker rooms in legal jurisdictions. Together with the open system architecture of the software platform and resultant reduced IT costs, the cost of ownership can be easily justified.

Flexible Licensing options

Depending on your budget and corporate IT strategies, you may choose any of our flexible licensing options:

- Term – Annual, includes bug fixes and minor enhancements
- Perpetual – Plus annual maintenance fees
- Source-code ownership – Does not include any on-going support beyond initial knowledge transfer

Consulting Services provides business value

Supergame is a solutions provider, and as such recognizes that even the most open software platforms will not readily meet all the requirements of an entertainment and gaming operator. Hence, to make your implementation successful, we also provide a series of consulting services:

- Implementation Project Management – We can follow a detailed eight phase deployment methodology or a rapid deployment schedule, depending – on your time-to-market needs and budget constraints.

- Technical Programming – We can provide you with technical assistance in extending the functionality of the application, using programmers that already know the architecture and internal of the application and can transfer knowledge to your IT staff.
- In case you are interested in totally out-sourcing your customizations and application development efforts, we also provide a service wherein your code-base will be maintained by our software development partners.

Supergame Facts
